

The Reason Why You Should Consider Hosting in The United States

Data Storage and Privacy

Small and medium-sized enterprises discover the United States's server facilities progressively attractive for stockpiling information and infrastructure.

For organizations considering the relocation of information stockpiling to the United States, the security guideline is most likely generally significant. It oversees the security protection that associations putting individual information, including infrastructure suppliers like HostnExtra. This standard covers the full scope of securities framework hosting customers would expect, including physical, and innovative measures.

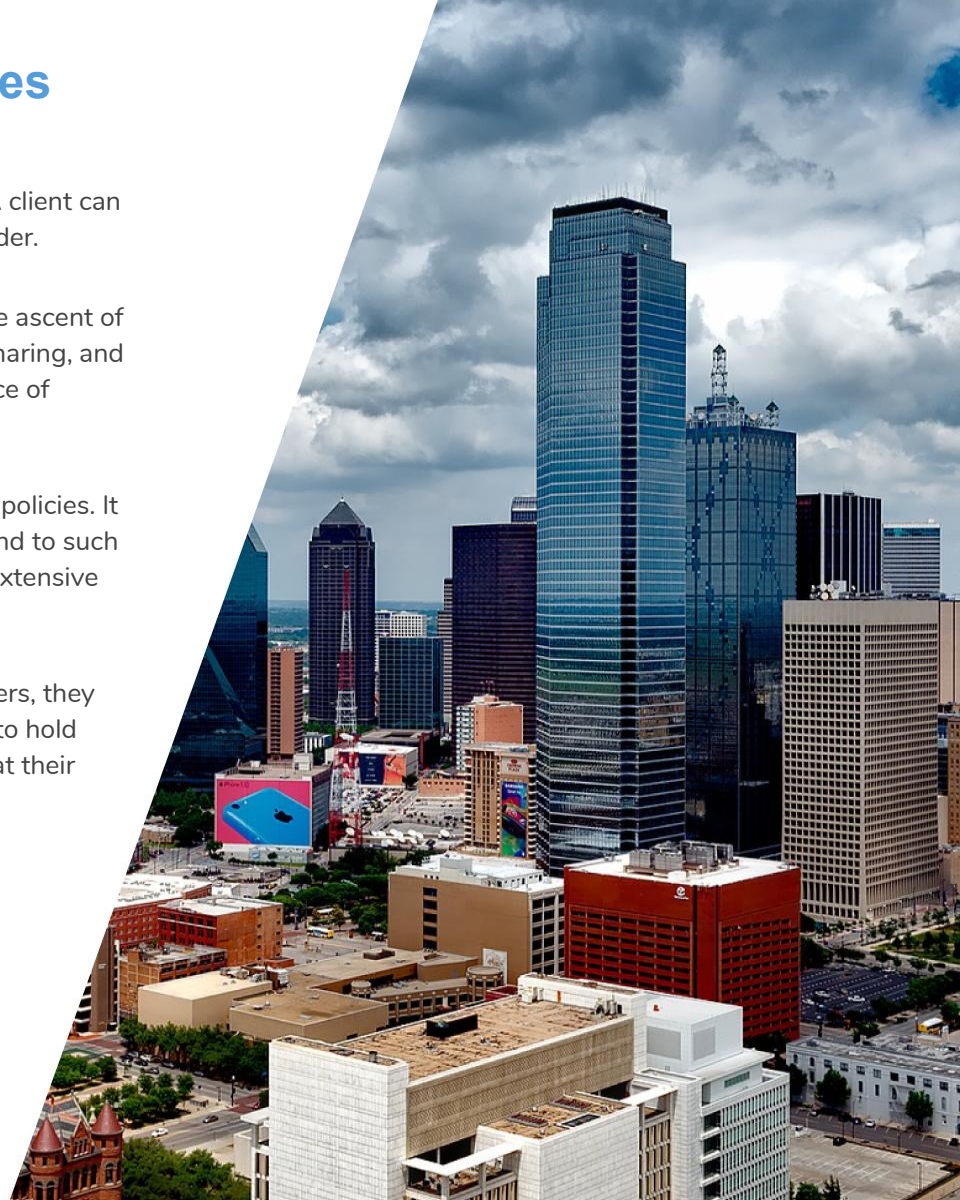

Data Privacy and Security In United States

It's a legal obligation to store personal data for any organization's policy. A client can expect that their data must secure by default from the infrastructure provider.

Data is one of the most significant resources an organization has. With the ascent of the information economy, organizations find colossal value in gathering, sharing, and utilizing information. Numerous organizations have taken in the significance of security the most difficult way possible.

Everybody can ask a company's compliance with any of PIPEDA's privacy policies. It is an obligation that the company must have a place to support and respond to such challenges. The organizations that store information is liable to the more extensive network.

When organizations store individual data in a the United States data centers, they obtain numerous security benefits, which makes it clear for organizations to hold fast to policies that value client security and information and to be sure that their private information stays safe and secure.

DDoS Protection

A DDoS attack is a Distributed Denial Of Service. A group of bot slaves is making requests of your website that are too great for it to handle. What this means for you is that your website becomes non-functional. What are bot slaves? Computers, sick with a virus forcing them to attack your website. Imagine your website is a physical location – the DDoS attack would be droves of mannequins filling your store, pushing your real customers out the door and preventing real customers from entering. These mannequins could potentially be in your store for days, effectively forcing your store to remain closed the entire time.

While there are many steps you can take to strengthen your defenses against a DDoS attack, from server location/configuration to hardware purchases/configuration, the simplest method is outsourcing your defense to a company that specializes in DDoS prevention.

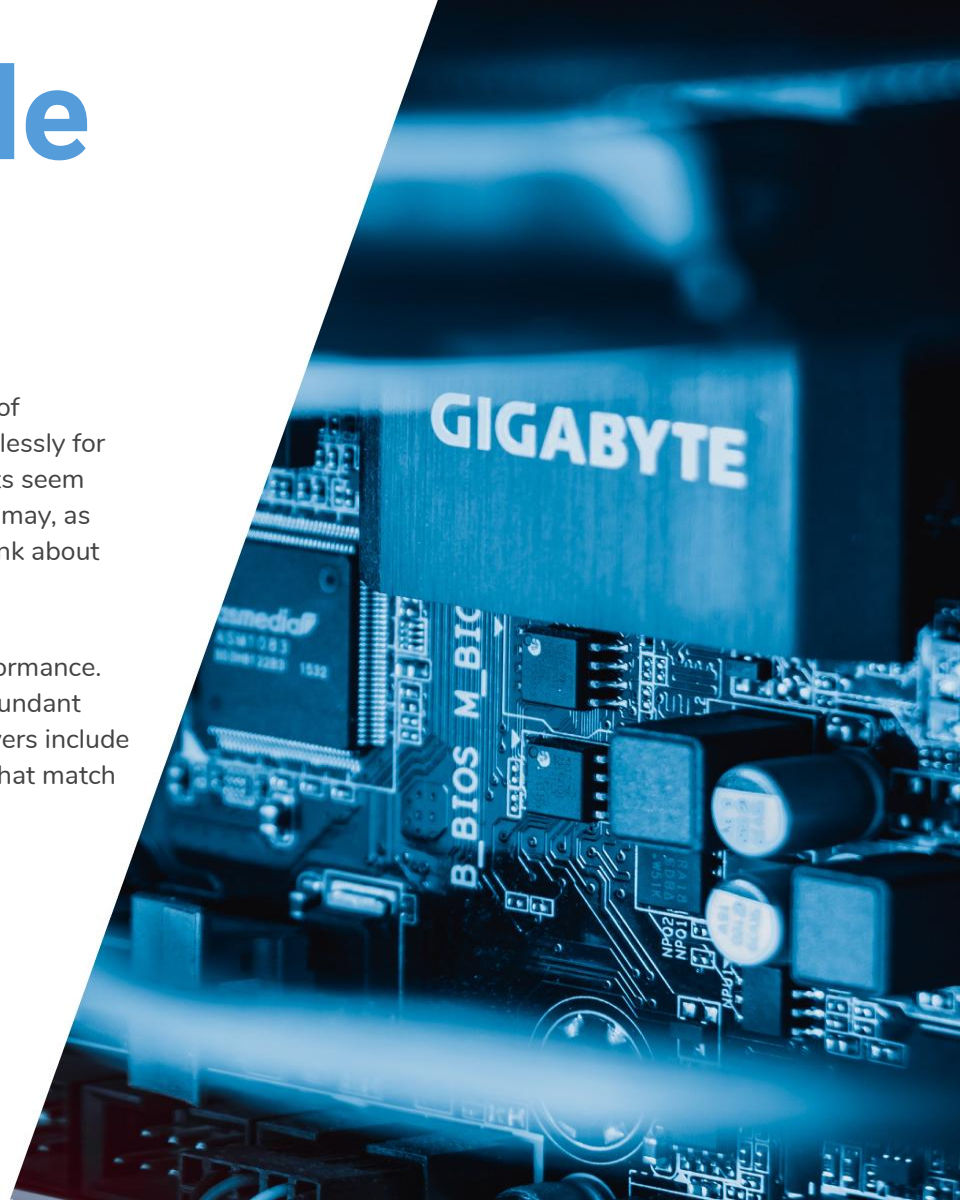

HostnExtra offers a unique choices for DDoS protection. We provide DDoS protected network to each servers. It take action within seconds if any servers face DDoS attack. The standard DDoS protected network is included with every HostnExtra services free of charge. Even if the neighboring server is the target of a DDoS attack, you can assured that your server will never be impacted.

Enterprise-grade Infrastructure

Enterprise-grade solutions should have the option to deal with petabytes of information from a huge number of information sources while scaling flawlessly for future development. From the start, numerous reinforcement arrangements seem comparable and similarly fit to fulfilling venture prerequisites. Be that as it may, as you look at the various contributions to check their cases, remember to think about the organization itself.

HostnExtra offers enterprise-grade infrastructure to boost the server performance. Dual Intel Xeon CPUs Redundant A+B power feeds 1Gbps to 10Gbps redundant bandwidth.
